

DriWater is an all natural watering gel used for plant irrigation. DriWater is 98% water and 2% food grade binders which are found in common items such as ice cream, mayonnaise and peanut butter. The product is safe around people and animals. DriWater liquefies when the gel comes in contact with soil. The natural bacteria in soil will consume the binders and release the water directly to the plant.

There are two suggested tests using DriWater that will show the most efficient way to water plants. DriWater is like a slowly melting ice cube that release water over long periods of time. We have two different delivery systems for your test;

2" Gel Pac - Indoor test. The DriWater 9 ounce 2" Gel Pac can water plants for approximately 30 days. You can use either a 6" or 8" pot with the same type of plant to show how to water with the least amount of water possible. The test is easy, water each plant, cut the Gel Pac to expose 1.5 inches of gel and place on one plant. Over the next 30 days, monitor the amount of liquid water needed for the other plant.

Quart carton- Indoor or outdoor test. The DriWater 32 ounce Quart carton will water plants for approximately 90 days. If the test is indoors, you should use a 10" or 12" pot. If the test is outdoors, you should use a plant that will show water stress so you know when to apply additional water. If it is hot and the plants are in the sun, the DriWater plant may need additional water as well. Be sure to add this amount to the water consumption totals for a true comparison.

The test kit includes four Quarts and six 2" Gel Pacs and sells for \$19.00 (retail value is \$30.05) which includes shipping to your school location. We have also included a test protocol form, data accumulation sheet and test synopsis to create a complete test from beginning to end.

DriWater is the most efficient way to water plants. Your students will enjoy this unique watering gel and to see the water savings when using time release water technology.
